

# SCS LED COATINGS

## SCS PARYLENE COATINGS FOR LEDs

Parylene conformal coatings from Specialty Coating Systems are ultra-thin, pinhole-free and provide unmatched protection for a wide array of LED applications.

From electronic displays and commercial applications to lighting for the automotive, marine and aircraft industries, LEDs must operate in harsh environments, including long-term UV exposure, temperature extremes and humidity. To ensure long-performance life (100,000 hours) while operating in extreme conditions, LEDs must be protected — and SCS Parylene conformal coatings provide that protection.

## LED APPLICATIONS

Due to their energy-efficiency, reduced package size and long life span, LEDs continue to replace existing lighting technologies across industries, allowing both manufacturers to offer new solutions to existing applications and designers to provide LED products for emerging technologies.

The following applications benefit from LED technologies today, and the list continues to grow:

- Video displays
- Transportation signage
- Aviation lighting
- Traffic signals
- Marine lighting
- Concert venue signage
- Electronic billboards
- Scoreboards
- Commercial refrigeration
- Vehicle lighting
- Outdoor illumination
- Structural lighting

## PARYLENE COATING PROPERTIES THAT PROTECT

### ULTRA-THIN AND LIGHTWEIGHT

SCS Parylene coatings are applied via a vapor deposition process in which the Parylene raw material (dimer) vaporizes into a gas. The gas (Parylene monomer) enters the ambient temperature chamber and polymerizes on the substrate. Since the coating is formed as a gas, it uniformly grows on all surfaces and edges, including inside the smallest crevices of a substrate.

Parylene's unique deposition process enables ultra-thin films to be formed in thicknesses ranging from several hundred angstroms to 75 microns. These thin films do not add significant weight to LEDs, potentially reducing the amount of structural framework necessary to support large signs.

### BARRIER PROPERTIES

SCS Parylenes provide pinhole-free barriers to protect against corrosive liquids, fluids, gases and chemicals, even with prolonged exposure to atmospheric conditions and elevated temperatures.

Circuit boards coated with SCS Parylene HT® were salt-fog tested by an independent testing facility. As seen in Figure 1, the coated boards showed no corrosion or salt deposits after 144 hours of exposure in accordance to ASTM B117-(03). Boards coated with Parylene C exhibited similar results.

### UV STABILITY AND OPTICAL CLARITY

LEDs must be able to withstand endless hours of exposure to ultraviolet light. SCS Parylene HT offers excellent UV stability, showing no degradation or discoloration after more than 2,000 hours of accelerated UV testing. Additionally, SCS Parylene coatings are optically clear, so the coating does not reduce the color or lumens output of the LEDs.

## Dielectric Properties

SCS Parylenes have excellent dielectric properties. Their high dielectric strength is attributable to the fact that they can be formed as thin, continuous films, free from the defects and fillers commonly found in conventional coatings that tend to reduce dielectric strength.

Parylene coatings also have low dielectric constants and dissipation factors, enabling electrical signal transfer without absorption or loss.

## Thermal Stability

LED applications, and the coatings that protect them, often encounter extreme temperatures. SCS Parylene HT is specifically engineered to provide long-term thermal stability up to 350°C, with short-term stability up to 450°C, providing reliable protection for the life of the LED.

## SCS Parylene Properties

		Method	Parylene HT	Parylene C	Parylene N	Acrylic (AR) <sup>a,b</sup>	Epoxy (ER) <sup>a,b</sup>	Polyurethane (UR) <sup>a,b</sup>	Silicone (SR) <sup>a,b</sup>
<b>UV Stability</b>		1	≥2,000 hrs	≤100 hrs	≤100 hrs	–	–	–	–
