

SPECIALTY COATING SYSTEMS™

A KISCO Company

SCS Equipment Services

Service Offering

Profile Engineering

SCS collaborates with customers to develop customized coating profiles that are precisely tailored to your product specifications and desired outcomes. This service accelerates equipment integration and optimizes production readiness by delivering a ready-to-use coating solution based on your specific requirements, including board dimensions, material type, thickness, tolerances and curing needs.

Advanced User Training

Our hands-on advanced training experience is conducted in the SCS demo lab and led by our team of coating application and system experts. This program follows specialized training guide materials to give participants an in-depth knowledge of their configured equipment (e.g., how to operate, program and optimize their specific coating system).

Factory Technician Installation

An SCS technician will visit your facility upon system delivery to support machine installation and review that required services are within specifications (e.g., supply air, spray air, electric power and exhaust flow) to meet factory operation requirements. Our technicians will verify machine setup and integration with associated machines and/or curing systems, making any necessary operational adjustments. Personnel supporting the machine will receive an overview of its operation, process considerations and recommended maintenance.

Technical Support Service Agreement

A Technical Support Service Agreement can ensure operational efficiency of your system for the duration of the agreement. An SCS field service technician conducts this service by providing on-site calibration, cleaning and expert service recommendations. This proactive approach helps mitigate the risk of production line downtime, safeguarding your investment.
